Kyle,

I chatted with Julia regarding PSP results on frequency of herbicide detections from forestlands, and she tells me you are correct: low concentrations, infrequently. For the Drinking Water Toxics Monitoring, it is about half of the systems with private forestland and little ag and federal forests that have detections of at least one herbicide. Time for me to eat some crow. I am checking on the Toxics Monitoring Program. I'll let you know what I find out which may involve more of the aforementioned snacking upon corvid.

Josh
